TracAdmin

[TracGuideToc]

Trac is distributed with a powerful command-line configuration tool. This tool can be used to configure and customize your Trac-installation to better fit your needs.

Some of those operations can also be performed via the web interface thanks to the optional WebAdmin plugin, distributed separately for now.

Usage

You can get a comprehensive list of the available options, commands and sub-commands by invoking `trac-admin` with the `help` command:

```
trac-admin help
```

Unless you're executing the `help`, `about` or `version` sub-commands, you'll need to specify the path to the TracEnvironment that you want to administer as the first argument, for example:

```
trac-admin /path/to/projenv wiki list
```

Interactive Mode

When passing the environment path as the only argument, `trac-admin` starts in interactive mode. Commands can then be executed on the selected environment using the prompt, which offers tab-completion (on non-Windows environments, and when the Python `readline` module is available) and automatic repetition of the last command issued.

Once you're in interactive mode, you can also get help on specific commands or subsets of commands:

For example, to get an explanation of the `resync` command, run:

```
> help resync
```

To get help on a all the Wiki-related commands, run:

```
> help wiki
```
