# Configuring Arch for a graphical interface

The base iso comes up in a terminal. We want some sort of graphical interface. My (JN) preference is **Openbox** with **tint2** and **conky** and **nitrogen**.

- Openbox: a window manager
- tint2: a system tray, a task list, a battery monitor and a clock
- conky: system monitor software for the X Window System. It allows a quite nice display of keyboard shortcuts
- nitrogen: lightweight desktop background browser and setter.

## 170319

Downloaded **archanywhere dual** and **revenge installer 32** as per Scott's notes. Note that revenge was put in a file that was NOT labelled ISO.

Created and installed (chose openbox, but that's maybe a poor idea – XFCE may be easier).

Then tried to run alsaplayer to play music.

Note need to create vmshare dir and mount it so I had some mp3 files.

```
sudo mount -t vboxsf vmshare vmshare # from home dir in guest
```

audacious plays, alsaplayer does not.

To get VBox Guest additions, had to mount /dev/sr0, install gcc and make from base-devel and run the VBoxLinuxAdditions.run

Managed to mess up arch anywhere.

Redo with xfce, changing to ALSA audio driver in VBox settings.

Change back to pulseaudio as no sound.

Reboot, but now file manager not working???

Could not get pacman to find mp3 stuff. And some apps not responding.

Try again with Revenge

```
Choose pulseaudio. LXDE
```

Tried to insert and run VBoxLinuxAdditions.run but no linux-headers.

```
pacman -S linux-headers # worked!
```

reboot

vboxadd.service failed and locked at end "Reached target Graphical Interface".

reboot

No good. So try again to install.

Choose:

```
linux-lts kernel
lxde
internet chromium
media audacious
utilities virtualbox leafpad ntfs-3g
```

Then insert VBox Guest Additions iso, open terminal and

```
sudo ./VBoxLinuxAdditions.run
```

Seems OK. So reboot.

Yes, screen sizing works. Mounted vmshare after creating. And audacious plays tunes.

```
pacman -S alsaplayer
```

```
does not work, but install implied MPEG support needs libmad.
```

```
pacman -S libmad
```

alsaplayer works!

Try Archanywhere again.

adding libmad got alsaplayer working.

Slightly different interface to revenge.
