Wiki Page Names 3

Wiki Page Names

Wiki page names commonly use the CamelCase convention. Within wiki text, any word in CamelCase automatically becomes a hyperlink to the wiki page with that name.

CamelCase page names must follow these rules:

1. The name must consist of **alphabetic characters only**. No digits, spaces, punctuation, or underscores are allowed.

2. A name must have at least two capital letters. 3. The first character must be capitalized. 4. Every capital letter must be followed by one or more lower-case letters. 5. The use of slash (/) is permitted in page names (possibly representing a hierarchy).

If you want to create a wiki page that doesn't follow CamelCase rules you can use the following syntax:

```
 * [[:Wiki_page]], [[:ISO9000]]
 * [[:"Space|Matters"]] that page name embeds space characters
 * or simply: [[:"WikiPageName"]]s (!MoinMoin's internal free links style)
```

This will be rendered as:

- Wiki_page, ISO9000
- Matters" that page name embeds space characters
- or simply "WikiPageName" (!MoinMoin's internal free links style)

See also TracLinks#QuotingspaceinTracLinks.

Finally, and as exemplified in the line above, one can also append an anchor to a Wiki page name, in order to link to a specific section within that page. The anchor can easily be seen by hovering the mouse over a section heading, then clicking on the)] sign that appears at its end. The anchor is usually generated automatically, but it's also possible to specify it explicitely, see WikiFormatting#using-explicit-id-in-heading
